## Search Notes

Dear Examiner Danneman :

Please find attached the results of your search for the above-referenced case. The search was conducted using the Business Methods Template Databases, EBSCH Ohost and ProQuest.

I have listed *potential* references of interest in the first part of the search results. However, please be sure to scan through the entire report. There may be additional references that you might find useful.

If you have any questions about the search, or need a refocus, please do not hesitate to contact me.

Thank you for using the EIC, and we look forward to your next search!

*Note: EIC-Searcher identified "potential references of interest" are selected based upon their apparent relevance to the terms/concepts provided in the examiner's search request.*

#### DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

(First embodiment)

Fig. 1 is a view showing an embodiment of the information...

...be outputted (printed).

In this process, an advertisement is printed in a space area or on the back surface of the sheet, together with the output information, whereby the print fee to be charged to the user can be alleviated.

An information medium 121 such as internet, a newspaper or a magazine also provides the P...

...from the terminal 120 or another information medium 121 and entering such P-code into the kiosk terminal 110 as explained in the foregoing. The fee for information output is variable according to various conditions such as presence/absence of advertisement, back-side printing, color/monochromatic printing etc.;

2) Mail print service: In case...

...this service allows the user to print the content (mail information) of the electronic mail by entering the P-code. Also in this service, the fee for information output is variable according to various conditions such as presence/absence of advertisement, back-side printing, color/monochromatic printing etc.;

3) Personal information service: This service...

...P-code). In entering such personal P-code, it is necessary to enter a password or the like into the personal verification device 115. The fee for information output is variable according to various conditions such as presence/absence of advertisement, back-side printing, color/monochromatic printing etc.; and

4) Data delivery service: This...

...P-code is issued, and the information can be outputted at any desired location by entering such P-code in the kiosk terminal 110. The fee for information output is variable according to various conditions such as presence/absence of advertisement, back-side printing, color/monochromatic printing etc.

Fig. 2 is a block diagram...information price column of the IP information registration table shown in Fig. 46. In this operation, the print charge is calculated in consideration of the fee for monochromatic or color printing and the fee for the print sheet, according to the print setting shown in Fig. 29.

In case the advertisement is inserted, the CanDINet control unit 100, after the above-mentioned...such schematic preview data. Also in this step, there may be displayed an image as shown in Fig. 37, for enabling the selection of the sheet size or the sheet direction. When the "OK" button is depressed on the preview image, the sequence returns to the step S1205.

Finally, when the "print..."

...by cash deposit in a coinreceiver provided in the kiosk terminal 110.

In cash of cash payment at the store counter, namely in case a bar code is to be printed on the sheet (step S1001 - Y), bar code print data are generated according to the print charge, in preparation for attaching to the print data received from the CanDINet control unit 100.

In...

...of the CanDINet control unit 100 in generating the print data, based on the P-code transmitted from the kiosk terminal 110 and the output format of the advertisement. When the print data are requested from the kiosk terminal 110, the CanDINet control unit 100 starts generation of the print data. Fig. 53 is a basic flow chart...

...the P-code acquired in the step S1701, are acquired from the database (step S1703). Also there is discriminated whether or not to generate the print data with advertisement, based on the output format of the advertisement acquired in the step S1702 (step S1704).

In case of generating the print data with advertisement (step S1704 - Yes), there are executed in succession a sheet size determination process (step S1705), a layout determination process (step S1706), an advertisement size determination process (step S1707), and an advertisement search process (step S1708). In case of generating the print data without advertisement (step S1704 - No), there are executed in succession a sheet size determination process (step S1709) and a layout determination process (step S1710).

These processes will be explained in the following.

(Sheet size determination process)

Fig. 18 is a flow chart showing the function of the CanDINet control unit 100 in the sheet size determination process. At first the service type is confirmed, and there is discriminated whether the service type is the mail print service (step S1801). If...

...print service (step S1801 - N), the process is started according to the flow chart shown in Fig. 19.

At first, a step S1802 sets the sheet size at a basic sheet size. The basic sheet size is the sheet size designated in the registration image shown in Fig. 63 in case the user applies for the registration to the CanDINet control unit 100, or the sheet size designated on a display image as shown in Fig. 37 in case the user can designate the sheet size on such display image on the kiosk terminal. If the user does not execute designation in either case, the basic sheet size is set as A4 size. The information necessary for determining the sheet size is memorized in a table format 4502 in Fig. 45 according to the designation by the user, in case the user applies for the registration...

...priority is given to the visibility or page number in the print data generation (step S1804). If the priority is given to visibility, a temporary sheet size is calculated by information size X reduction limit value (step S1805). If the priority is given to page number, a temporary sheet size is selected equal to the information size (step S1809).

Then there is discriminated whether the temporary sheet size determined in the step S1805 or S1809 is larger than the sheet size (step S1806). If the temporary sheet size is larger than the sheet size (step S1806 - Yes), there is selected the minimum sheet size satisfying the condition that sheet size = temporary sheet size (step S1810). If the temporary sheet size is not larger than the sheet size, or if the temporary sheet size is same as the sheet size, the temporary sheet size

is selected as the sheet size (step S1807).

Once the sheet size is determined, there is discriminated whether next information data are present (step S1808). If present (step S1808 - Yes), there is acquired the information size of such information data (step S1811) and the sequence returns to the step S1804. If the next information data are absent (step S1808 - No), the final sheet size is determined from the current sheet size and the standard advertisement ratio, and the present process is terminated.

On the other hand, if the service type is the mail print service, a process is executed according to the flow chart shown in Fig. 19. At first, a step S1901 sets the sheet size at a basic sheet size. The basic sheet size is the sheet size designated in the registration image shown in Fig. 63 in case the user applies for the registration to the CanDINet control unit 100, or the sheet size designated on a display image as shown in Fig. 37 in case the user can designate the sheet size on such display image on the kiosk terminal. If the user does not execute designation in either case, the basic sheet size is set as A4 size. The information necessary for determining the sheet size is memorized in a table format 4502 in Fig. 45 according to the designation by the user, in case the user applies for the registration...

...is present.

Then there is discriminated whether an image file is attached to the mail (step S1903). If not attached (step S1903 - No), a temporary sheet size is selected as 0 X 0 (step S1907). If the image file is attached (step S1903 - Yes), the sequence proceeds to a step S1904.

Then...

...priority is given to the visibility or page number in the print data generation (step S1904). If the priority is given to visibility, a temporary sheet size is calculated by image file size X reduction limit value (step S1905). If the priority is given to page number, a temporary sheet size is selected equal to the image file size (step S1906).

Then there is discriminated whether the temporary sheet size determined in the step S1905, S1906 or S1907 is larger than the sheet size (step S1908). If the temporary sheet size is larger than the sheet size (step S1908 - Yes), there is selected the minimum sheet size satisfying the condition that sheet size = temporary sheet size (step S1910). If the temporary sheet size is not larger than the sheet size, or if the temporary sheet size is same as the sheet size, the temporary sheet size is selected as the sheet size (step S1909).

Once the sheet size is determined, there is discriminated whether a next mail is present (step S1911). If present (step S1911 - Yes), there is acquired the information on such mail (step S1912) and the sequence returns to the step S1903. If the next mail is absent (step S1911 - No), the final sheet size is determined from the current sheet size and the advertisement ratio, and the present process is terminated. In the present embodiment, the advertisement ratio is selected same as the standard ratio of...

...flow chart showing the function of the CanDINet control unit 100 in the layout determination process. At first the CanDINet control unit 100 executes an advertisement area securing process for securing an advertisement area (step S2001).

Fig. 80 is a flow chart showing the function of the CanDINet control unit 100 in the advertisement area securing process. At first there is determined the ratio of the amount of advertisement (step S8001). In the present embodiment, the advertisement ratio is selected...

...2) printing the advertisement on the separate sheet, the advertisement ratio in this stage is selected as 0. It is however memorized to form an advertisement area on the back side in case of selection (1), and to form an advertisement area on another sheet in case of selection (2).

Then there is discriminated whether a predetermined layout is to be used for all the services, or...

...mode of the CanDINet control unit 100 for providing the advertisement service.

If the predetermined layout is to be used for all the services, the advertisement area is secured with such predetermined layout.

In this case, the size of the advertisement area follows the ratio of amount of the advertisement. In the present embodiment, the predetermined layout is given by 7902 in Fig. 79.

If the layout is to be changed according to the service type, the advertisement area is secured with a layout corresponding to each service type. Also in this case, the size of the advertisement area follows the ratio of amount of the advertisement. In the present embodiment, the layout for the mail print service is given by 7901 or 7902...

...places the information data and tries to secure the area of the information size for placing such information data but such area overflows from the sheet size or invades the advertisement area, the layout is made on the next page.

If the priority is given to the page number in generating the print data (step S2002 - No...

...next information data are no longer present (step S2010 - No), the area containing the information data is enlarged within an extent not overflowing from the sheet size and not invading the advertisement area (step S2012), thereby expanding the information data as far as possible.

If the step S2009 places the information data and tries to secure the area of the information size for placing such information data but such area overflows from the sheet size or invades the advertisement area, the layout is made on the next page.

(Advertisement area determination process)

In the following there will be explained a process for determining the advertisement area. Fig. 21 is a flow chart showing the function of the CanDINet control unit 100 in determining the advertisement area.

At first, the advertisement area is selected as the print area by the printing unit of the kiosk terminal minus the information data area (step S2101).

Then there is prepared a variable "advertisement size",

which is initially selected as the largest advertisement size (step S8302). In the present embodiment, the advertisement size is limited to predetermined plural sizes. The advertisement provider is to select one of such predetermined sizes at the registration of the advertisement.

Then there is discriminated whether the advertisement size can be accommodated in the advertisement area (step S2103). If accommodatable (step S2103 - Yes), there is secured an advertisement area of such advertisement size (step S2104), and the advertisement area is defined as the remaining advertisement area after such securing (step S2105).

If the advertisement size cannot be accommodated in the advertisement area (step S2103 - No), there is discriminated whether the advertisement size is the smallest advertisement size (step S2106). If there is a smaller advertisement size (step S2106 - No), the next largest advertisement size is selected as the advertisement size (step S2107) and the sequence returns to the step S2103. If there is no smaller advertisement size (step S2106 - Yes), the present process is terminated. In the step S2104, there are memorized the secured advertisement size and the secured location.

In the following there will be explained the process of determining the advertisement area in case the advertisement is to be printed on the back side or on another sheet. Figs. 83 to 85 are flow charts showing the function of the CanDINet control unit 100 in determining the advertisement area.

At first, the advertisement area is selected as the print area by the printing unit of the kiosk terminal minus the information data area (step S8301).

Then there is prepared a variable "advertisement size", which is initially selected as the largest advertisement size (step S8302). In the present embodiment, the advertisement size is limited to predetermined plural sizes. The advertisement provider is to select one of such predetermined sizes at the registration of the advertisement.

Then there is discriminated whether the advertisement size can be accommodated in the advertisement area (step S8303). If accommodatable (step S8303 - Yes), there is secured an advertisement area of such advertisement size (step S8304), and the advertisement area is defined as the remaining advertisement area after such securing (step S8305).

If the advertisement size cannot be accommodated in the advertisement area (step S8303 - No), there is discriminated whether the advertisement size is the smallest advertisement size (step S8306). If there is a smaller advertisement size (step S8306 - No), the next largest advertisement size is selected as the advertisement size (step S8307) and the sequence returns to the step S8303. If there is no smaller advertisement size (step S8306 - Yes), the sequence proceeds to a step S84 in Fig. 84.

A flow chart shown in Fig. 84 determines the advertisement area in case the advertisement area is secured on the back side. For this purpose, there is at first discriminated whether an advertisement area is secured on the back side (step S8401).

The discrimination is made by checking whether the step S8001 in Fig. 80 has memorized securing the advertisement area on the back side.

If the advertisement area is secured on the back side, the advertisement area is selected as the print area by the printing unit of the kiosk terminal minus the information data area (step S8402). Steps S8403 to S8408...

...be explained as they are similar to the step S8303 to S8308 in Fig. 83. In case the step S8407 identifies the absence of smaller advertisement size, the sequence proceeds to a step S8501 in Fig. 85.

When an advertisement area is secured in another sheet, the flow chart in Fig. 85 executes a process for determining the advertisement area. For this purpose, there is at first discriminated whether an advertisement area is secured on another sheet (step S8501). The discrimination is made by checking whether the step S8001 in Fig. 80 has memorized securing the advertisement area on another sheet.

If the advertisement area is secured on another sheet, the advertisement area is selected as the print area by the printing unit of the kiosk terminal (step S8502). Steps S8503 to S8508 will not be explained as they are similar to the step S8303 to S8308 in Fig. 83. In case the step S8507 identifies the absence of smaller advertisement size, the advertisement area determining process is terminated. The steps S8304, S8404 and S8504 memorize the secured advertisement size and the secured location.

In an example shown in Fig. 54, the advertisement areas are secured in succession for the advertisements 1, 2, 3 and...geographical area in which the advertisement data are printed.

On the registration display image shown in Fig. 68, the advertisement provider can select the printed advertisement size among the predetermined sizes, and whether the advertisement size can be changed or not.

Also on the registration display image shown in Fig. 69, there can be designated a full-page advertisement, a top...

...step S1711 in Fig. 17. In this step, the print data are generated by selecting to the advertisement data to be inserted, from the secured advertisement size and the secured location stored in the advertisement size determination process of the step S1707 and from the search result list prepared in the advertisement search process in the step S1708.

The CanDINet control...

...data to be inserted, by discriminating, in the descending order of matching level of the advertisement P-code in the search result list, whether the advertisement size memorized in the advertisement information table corresponding to such P-code matches the advertisement size determined in the advertisement size determination process. In this operation, consideration is made not only on the advertisement size but also on whether the size is adjustable.

Also if the selected advertisement data include an advertisement designated for page-top insertion, the layout is...

...advertisement 3 in Fig. 54, the layout is changed as shown in Fig. 55. Fig. 56 shows an example of the printout of thus generated print data.

In case the output format of the advertisement determined in the step S1702 in Fig. 17 designates the advertisement printing on the back side or advertisement printing also on the back side, there are at first generated the print data for outputting the information data with the layout determined in the layout determination process (step S1706 in Fig. 17) and then generated are the print data for printing the selected advertisement data on...

...format of the advertisement determined in the step S1702 in Fig. 17 designates the advertisement printing on another sheet, there are at first generated the print data for outputting the information data with the layout determined in the layout determination process (step S1706 in Fig. 17) and, after a page change, there are generated the print data for printing the...

...an upper or lower limit. Such limit avoids unlimited payment of the advertisement charge.

Also the variable print charge can be indicated by printing a bar code together with the printing of the information and can be promptly settled, without error, by reading such bar code.

Also the printing of the advertisement on the back side allows effective utilization of the sheet area even with a simple layout rule, and the advertisement can be inserted without influencing the layout of the information. Also the value of the advertisement...

...free of charge by including advertisement) prints, the user is allowed to acquire simplified information from the mobile terminal and detailed information by print on paper. Such configuration drastically improves the convenience of access to information, and stimulates the sales activity in the convenience store as such location attracts more people.

Also the...selection means is cash payment.

259. An information processing apparatus according to clause 258, wherein said symbol indicating the amount of said charge is a bar code.

260. An information processing apparatus according to clause 258, wherein the amount of said charge is variable according to additional information attached to said information...

...selection step is cash payment.

315. An information processing method according to clause 314, wherein said symbol indicating the amount of said charge is a bar code.

316. An information processing method according to clause 314, wherein the amount of said charge is variable according to additional information attached to said information...

...said selection step is cash payment.

371. A memory medium according to clause 370, wherein said symbol indicating the amount of said charge is a bar code.

372. A memory medium according to clause 370, wherein the amount of said charge is variable according to additional information attached to

said information.

Information processor for informational service, has determining unit which

determines output layout of addition information, based on type of  
output service identified by recognition unit  
...INOUE A...

...ITO K...

...IZUMI J...

...KASAI K...

...MASUKAWA A...

...SATOMI H

Alerting Abstract ...NOVELTY - A determination unit determines the output  
layout of addition information based on the type of output service  
identified by recognition unit....USE - For informational service e.g.  
internet web, electronic mail, facsimile advertisement, free-dial  
inquiry, data claim postcard sending.

...

...ADVANTAGE - As the sponsor advertisement is optimally added, the  
cost of user's information acquisition is reduced

Alerting Abstract ...to be output corresponding to the code information,  
attribute information is acquired. The attribute information also acquired  
based on additional information relevant to output information.  
Layout of output information and the additional information is  
determined based on the acquired attribute information....USE - For  
processing information for providing services such as internet web,  
internet push type news delivery service, facsimile information extraction  
service, sponsor advertisement, free dial inquiry, postcard sending,  
electronic mail information.  
...

...ADVANTAGE - Reduces user's information acquisition cost, enables  
obtaining desired information in a suitable layout.

#### ABSTRACT

PROBLEM TO BE SOLVED: To transmit one-way Information such as advertisement information to a user by appropriate quantity and at appropriate timing by executing a prescribed operation on all the keywords of respective pieces of candidate...

... of candidate information and objective output information is selected from plural pieces of candidate information based on the total value of operation results. In an advertisement retrieval processing, a keyword list is generated in a step S3001, for example. In a step S3002, advertisement information having the keyword matched with a retrieval key is retrieved with the respective keywords as the retrieval keys based on the keyword list. In a step S3006, the most appropriate layout example is selected from the advertisement layout examples of a step S3005.

#### ABSTRACT

PROBLEM TO BE SOLVED: To automatically and also quickly produce analytical materials shown in the state in which a product printed on an advertisement is visually associated with the sales information of the product by producing sales information layout data which arranges the sales data of each product on the display position of each product in edition data.

SOLUTION: A control unit 10 lays out sales data received from a POS system 2 on edition data expanded on a memory 14 and produces sales information layout data. Next, accumulated data obtained by the sales data and accumulation processing are arranged on edition data according to a display format set in layout setting processing. Thus, edited data in a state where numerical values showing the sales information, etc., are shown on the displaying part of each product of an advertisement printed matter, i.e., sales information layout data are obtained. The obtained sales information layout data are shown on the display 18 and are printed from a printer 20 as occasion demands.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

Preferred embodiments of the present invention will be hereinafter described with reference to the drawings.

&lt;System...

...to the information obtained in response to the input of the P code by the user (IP information or the like) (hereinafter referred to as advertisement information).

As an example of a service to be realized in the above-mentioned P service system, the following services are mainly described in this...

...or the IP server 400) in response to a registration application of the IP information and a P code for the IP is given.

(3) Advertisement information registration:

Advertisement information is registered in the P service server

300 (or the IP server 400) in response to a registration application of the advertisement information.

(4) Information service: A P code (P code for the IP) of desired information is inputted from the P service terminal 200, whereby a...the CPU 302 is stored in the memory 303. Information registration processing 303a is a program module for performing registration of, for example, IP information, advertisement information, user information (personal information), distribution data for distribution service and receiving service. In addition, P code issue processing 303b is a program module for assigning a P code for specifying each of registered information. Service processing 303c obtains IP information, advertisement information, mail data and distribution data or performs registration of distribution data according to a P code transmitted from the P service terminal 200. Advertisement search processing 303d searches advertisement information that should be added in print output in the P service terminal. By adding advertisement information in this way, an information output fee is covered by an advertisement fee, whereby charges born by a user at the time of information output (at the time of printing) are reduced. Reference numeral 303e denotes data output processing, which adds advertisement information obtained by the advertisement search processing to information obtained based on a P code inputted from the P service terminal 200 to perform layout on a print sheet, and generates print data to output it.

Reference numeral 304 is a communication portion, which is used for connecting with the...

...305a for a P code and an entity of contents 305b. The table group 305a includes an IP information registration table 311 (Fig. 7), an advertisement information table 312 (Fig. 8), a user information table 313 (Figs. 9A, 9B and 9C), a P code table for mailing service 314 (Fig. 10...

...terms and conditions for inserting articles. In addition, the basic property includes "a keyword list" and "a keyword weighted list", which are utilized by the advertisement search processing 303d. The entity file information specifies entity data of the IP information and includes a pass name and a file name of the...

...in the P service server 300 while others exist in the IP server 400.

Fig. 8 illustrates an example of a data configuration of the advertisement information table 312. The advertisement information table is generated and recorded when an advertiser registers advertisement information. An advertisement property, a link and entity file information of the advertisement information are stored for an assigned P code in the advertisement information table 312. Information indicating an owner of the advertisement information and terms and conditions for inserting the advertisement information are registered in the advertisement property. Further, a target keyword list and a target keyword weighted list to be utilized in the advertisement search processing 303d are stored in "information of a link to IP information" of the advertisement property.

A P code of other advertisement information to which the advertisement information should be linked is stored in the link. In addition, a pass name and a file name for specifying a file of the advertisement information are registered in the entity file

information. Further, although the entity of the advertisement information may be in either the P service server 300 or the IP server 400, the advertisement information table 312 is always stored in the P code database 305 of the P service server 300. Further, it is needless to mention that, if the entity of the advertisement information is in the IP server 400, the entity file information of the advertisement information table 312 includes information for specifying the IP server 400 (an IP server is specified by a P code in this embodiment, which will...

...information table 319. This table is a table linked to "an owner ID" in the IP information registration table shown in Fig. 7 or the advertisement information table shown in Fig. 8. Information on an owner (information provider, advertiser) is registered in the owner information table 319 as shown in Fig...

...of interest or the like can be inputted in a user profile in addition to information such as an address and a name, and an advertisement suitable for the interests of the user is searched in step S1923 using this information. In addition, the user can also set an output format of a layout at the time of print-out (a layout pattern such as "ease of viewing is prioritized" or "the number of pages is prioritized", an amount of advertisement information, a font size, or the like). In addition, when the user registers information for a mailing service in a user information table, a dialog...

...not a fee is charged for this IP information, whether or not change of a size is allowable, whether or not automatic addition of an advertisement is permitted, a term of information validity and addition of a genre keyword for search is interactively performed. In addition, a plurality of pieces of IP information can be grouped, and information of the grouping is set as frame information.

Returning to Fig. 18, if an advertisement information registration request is inputted, the processing advances from step S1904 to step S1914, where a P code is issued, and advertisement information registration processing is executed in step S1915. In this advertisement information registration processing, the advertisement information table 312 shown in Fig. 8 is generated and registered in the P service server 300. An advertisement provider accesses the P service server 300 or the IP server 400 from a not-shown terminal owned or otherwise possessed by the advertisement provider (hereinafter referred to as an advertisement provider terminal) via the Web, whereby the registration is performed. As shown in the advertisement information table 312 of Fig. 8, information of an advertisement provider, a term of validity of advertisement insertion, a size, an inserting position, a maximum number of printing, an insertion fee of an advertisement, a keyword to be used in searching an advertisement and the like are set as an advertisement property.

In addition, if a P code is inputted from the P service terminal 200, it is determined which processing of step S1905 to step...

...data.

Further, when necessary information has been obtained in each step of S1916 to S1920, the P service server 300 determines in step S1922 a

layout for printing the obtained information on a sheet. Then, in step S1923, the P service server 300 obtains advertisement information that should be inserted in a blank on the sheet (incidentally, advertisement information in a field of the user... 7, it is evident that a P code may be issued with reference to this validity.

Further, the step of issuing a P code to advertisement information S1914 is similar to an issuing method of a P code to IP information.

<P code issue processing of electronic mail information>...  
...in an area 10305.

An area 10306 is an area for displaying printing contents of a print object mail in the area 10306. Further, an "advertisement setting" button may be added to the area to allow a user to insert an advertisement together with the mail or to allow the P service server 300 to search an appropriate advertisement and a print object mail to print them altogether.

A button 10307 is pressed down when a print preview display of a print object mail...the preview image and the number of pages on the touch panel 204. Here, if an instruction of a print preview or setting of an advertisement is instructed, the P service terminal 200 properly displays a corresponding screen and receives an input from the user.

In step S12404, (8) the P...

...is substantially the same as that in the case where a P code for an information service is inputted, its description is omitted here.

<Advertisement search processing>

In a P service system, if a user obtains print output in the P service terminal 200, a fixed advertisement information is automatically added to the print except the case where the user rejects it or the case where the information provider or the like rejects it. Search processing of advertisement information to be added at the time will be hereinafter described.

Fig. 36 is a flow chart of advertisement search processing.

In step S13301, a keyword list of information of an information service or a personal information service to be an object of print...

...taking socially accepted ideas into account and based on the contents on the P service system side and is used for defining a priority of advertisement information in this advertisement search processing.

In step S13302, using each keyword as a search key based on the keyword list prepared in step S13301, advertisement information having a keyword coinciding with the search key is searched. A list of the search results is prepared in step S13303. A degree of coincidence of the searched advertisement information is simultaneously calculated making use of a weight of the each keyword.

In step S13304, each piece of the advertisement information is rearranged with reference to a property and a degree of coincidence enumerated in the search result list.

In step S13305, an example layout of the advertisement information is prepared. A plurality of example layouts are prepared by picking up the pieces of advertisement information in the order of a priority from the rearranged search result list.

In step S13306, one example layout, which is considered to be the most appropriate taking a request of a user, a print size, a total charge or the like into account, is selected out of the example layouts of the advertisement information. Then, a P code, conditions of a layout and the like of the advertisement information are specified and temporarily saved, and the advertisement search processing is complete.

<Other embodiments>

Further, the present invention may be applied to a system composed of a plurality of appliances (e...)

#### DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

Preferred embodiments of the present invention will be hereinafter described with reference to the drawings.

<System configuration...>

...to the information obtained in response to the input of the P code by the user (IP information or the like) (hereinafter referred to as advertisement information).

As an example of a service to be realized in the above-mentioned P service system, the following services are mainly described in this...

...the IP server 400) in response to a registration application of the IP information and a P code for the IP is given.

3. (3) Advertisement information registration:

Advertisement information is registered in the P service server 300 (or the IP server 400) in response to a registration application of the advertisement information.

4. (4) Information service: A P code (P code for the IP) of desired information is inputted from the P service terminal 200, whereby...

...the CPU 302 is stored in the memory 303. Information registration processing 303a is a program module for performing registration of, for example, IP information, advertisement information, user information (personal information), distribution data for distribution service and receiving service. In addition, P code issue processing 303b is a program module for assigning a P code for specifying each of registered information. Service processing 303c obtains IP information, advertisement information, mail data and distribution data or performs registration of distribution data according to a P code transmitted from the P service terminal 200. Advertisement search

processing 303d searches advertisement information that should be added in print output in the P service terminal. By adding advertisement information in this way, an information output fee is covered by an advertisement fee, whereby charges born by a user at the time of information output (at the time of printing) are reduced. Reference numeral 303e denotes data output processing, which adds advertisement information obtained by the advertisement search processing to information obtained based on a P code inputted from the P service terminal 200 to perform layout on a print sheet, and generates print data to output it.

Reference numeral 304 is a communication portion, which is used for connecting with the...

...code and an entity of contents 305b. The table group 305a includes an IP information registration table 311 (<FIGREF IDREF=F0005>Fig. 7</FIGREF>), an advertisement information table 312 (<FIGREF IDREF=F0006>Fig. 8</FIGREF>), a user information table 313 (<FIGREF IDREF=F0007>Figs. 9A</FIGREF>, <FIGREF IDREF=F0008>9B</FIGREF>...

...terms and conditions for inserting articles. In addition, the basic property includes "a keyword list" and "a keyword weighted list", which are utilized by the advertisement search processing 303d. The entity file information specifies entity data of the IP information and includes a pass name and a file name of the...

...server 300 while others exist in the IP server 400.

<FIGREF IDREF=F0006>Fig. 8</FIGREF> illustrates an example of a data configuration of the advertisement information table 312. The advertisement information table is generated and recorded when an advertiser registers advertisement information. An advertisement property, a link and entity file information of the advertisement information are stored for an assigned P code in the advertisement information table 312. Information indicating an owner of the advertisement information and terms and conditions for inserting the advertisement information are registered in the advertisement property. Further, a target keyword list and a target keyword weighted list to be utilized in the advertisement search processing 303d are stored in "information of a link to IP information" of the advertisement property.

A P code of other advertisement information to which the advertisement information should be linked is stored in the link. In addition, a pass name and a file name for specifying a file of the advertisement information are registered in the entity file information. Further, although the entity of the advertisement information may be in either the P service server 300 or the IP server 400, the advertisement information table 312 is always stored in the P code database 305 of the P service server 300. Further, it is needless to mention that, if the entity of the advertisement information is in the IP server 400, the entity file information of the advertisement information table 312 includes information for specifying the IP server 400 (an IP server is specified by a P code in this embodiment, which will...

...table is a table linked to "an owner ID" in the IP information registration table shown in <FIGREF IDREF=F0005>Fig. 7</FIGREF> or the advertisement information table shown in <FIGREF IDREF=F0006>Fig.

8</FIGREF>. Information on an owner (information provider, advertiser) is registered in the owner information table 319...

...of interest or the like can be inputted in a user profile in addition to information such as an address and a name, and an advertisement suitable for the interests of the user is searched in step S1923 using this information. In addition, the user can also sets an output format of a layout at the time of print-out (a layout pattern such as "ease of viewing is prioritized" or "the number of pages is prioritized", an amount of advertisement information, a font size, or the like). In addition, when the user registers information for a mailing service in a user information table, a dialog...

...not a fee is charged for this IP information, whether or not change of a size is allowable, whether or not automatic addition of an advertisement is permitted, a term of information validity and addition of a genre keyword for search is interactively performed. In addition, a plurality of pieces of IP information can be grouped, and information of the grouping is set as frame information.

Returning to <FIGREF IDREF=F0017>Fig. 18</FIGREF>, if an advertisement information registration request is inputted, the processing advances from step S1904 to step S1914, where a P code is issued, and advertisement information registration processing is executed in step S1915. In this advertisement information registration processing, the advertisement information table 312 shown in <FIGREF IDREF=F0006>Fig. 8</FIGREF> is generated and registered in the P service server 300. An advertisement provider accesses the P service server 300 or the IP server 400 from a not-shown terminal owned or otherwise possessed by the advertisement provider (hereinafter referred to as an advertisement provider terminal) via the Web, whereby the registration is performed. As shown in the advertisement information table 312 of <FIGREF IDREF=F0006>Fig. 8</FIGREF>, information of an advertisement provider, a term of validity of advertisement insertion, a size, an inserting position, a maximum number of printing, an insertion fee of an advertisement, a keyword to be used in searching an advertisement and the like are set as an advertisement property.

In addition, if a P code is inputted from the P service terminal 200, it is determined which processing of step S1905 to step...data.

Further, when necessary information has been obtained in each step of S1916 to S1920, the P service server 300 determines in step S1922 a layout for printing the obtained information on a sheet. Then, in step S1923, the P service server 300 obtains advertisement information that should be inserted in a blank on the sheet (incidentally, advertisement information in a field of the user's interest is searched and obtained based on the user information table 313 of the user). Then, in...

...FIGREF>, it is evident that a P code may be issued with reference to this validity.

Further, the step of issuing a P code to advertisement information S1914 is similar to an issuing method of a P code to IP information.

Processing when an electronic mail is sent to the mail...

...in an area 10305.

An area 10306 is an area for displaying printing contents of a print object mail in the area 10306. Further, an "advertisement setting" button may be added to the area to allow a user to insert an advertisement together with the mail or to allow the P service server 300 to search an appropriate advertisement and a print object mail to print them altogether.

A button 10307 is pressed down when a print preview display of a print object mail...the preview image and the number of pages on the touch panel 204. Here, if an instruction of a print preview or setting of an advertisement is instructed, the P service terminal 200 properly displays a corresponding screen and receives an input from the user.

In step S12404, (8) the P...

...processing is substantially the same as that in the case where a P code for an information service is inputted, its description is omitted here.  
<Advertisement search processing>

In a P service system, if a user obtains print output in the P service terminal 200, a fixed advertisement information is automatically added to the print except the case where the user reject it or the case where the information provider or the like rejects it. Search processing of advertisement information to be added at the time will be hereinafter described.

<FIGREF IDREF=F0034>Fig. 36</FIGREF> is a flow chart of advertisement search processing.

In step S13301, a keyword list of information of an information service or a personal information service to be an object of print...

...taking socially accepted ideas into account and based on the contents on the P service system side and is used for defining a priority of advertisement information in this advertisement search processing.

In step S13302, using each keyword as a search key based on the keyword list prepared in step S13301, advertisement information having a keyword coinciding with the search key is searched. A list of the search results is prepared in step S13303. A degree of coincidence of the searched advertisement information is simultaneously calculated making use of a weight of the each keyword.

In step S13304, each piece of the advertisement information is rearranged with reference to a property and a degree of coincidence enumerated in the search result list.

In step S13305, an example layout of the advertisement information is prepared. A plurality of example layouts are prepared by picking up the pieces of advertisement information in the order of a priority from the rearranged search result list.

In step S13306, one example layout, which is considered to be the most appropriate taking a request of a user, a print size, a total charge or the like into account, is selected out of the example layouts of the advertisement information. Then, a P code, conditions of a layout and the like of the advertisement information are specified and temporarily saved, and the advertisement search processing is complete.

<Other embodiments>

Further, the present invention may be applied to a system composed of a plurality of appliances (e.g., a...

registration processing 203a is a program module for registering, e.g., IP information, advertisement information, user information (personal information), the distribution data. P-code issue processing 203b is a program module for assigning a P-code for specifying each registered information. Service processing 203c acquires IP information, advertisement information, mail data, or distribution data or registers distribution data in accordance with a P-code transmitted from the P service terminal 100. Advertisement search processing 203d searches for advertisement information to be attached to a print output in the P service terminal. By attaching advertisement information, the information output charge is canceled by advertisement charges to reduce the cost for the user to bear in outputting information (printing). Data output processing 203e attaches advertisement information obtained by advertisement search processing to information obtained on the basis of a P-code input from the P service terminal 100, lays out the pieces of information...

...a table group 205a associated with P-codes and entity 205b of contents. The table group 205a includes an IP information registration table (Fig. 7), advertisement information table (Fig. 8), user information table (Fig. 9), mail service P-code table (Fig. 10), distribution service P-code table (Fig. 11), personal information...

...owner of the IP information and article insertion condition. The basic properties include a "keyword list" and "keyword weight list" which are used by the advertisement search processing 203d (details will be described later). The entity information specifies the entity data of ...table are present in the P service server 200 or IP server 300.

Fig. 8 is a view showing a data structure example of the advertisement information table. The advertisement information table is generated and recorded when an advertiser registers advertisement information. The advertisement properties, link, and entity file information of the advertisement information are stored in correspondence with an assigned P-code. The advertisement properties store information representing the owner of the advertisement information and insertion conditions of the advertisement information. The "link information to IP information" of the advertisement properties stores a target keyword list and target keyword weight list used in the advertisement search processing 203d.

The "link" stores the P-code of advertisement information to be linked. In the "entity file information", the path name and file name for specifying the file of the advertisement information are registered. The entity of the advertisement information can be present in either the P service server or IP service server. However, the advertisement information table is always stored in the P-code database 205 of the P service server 200. When the entity of advertisement information is present in the IP service server, information for specifying the IP service server is included in the entity file information of the advertisement information table (in this embodiment, the IP server is specified by the P-code, and this will be described later).

Fig. 9 is a view...

...example of an owner information table. This table is linked to the IP information registration table shown in Fig. 7 is "owner ID" in the

advertisement information table shown in Fig. 8. As shown in Fig. 14, information associated with the owner (information provider or advertiser) is registered.

Fig. 15 is...registration processing is performed. By this IP information registration processing, the IP information registration table shown in Fig. 7 is generated and registered. When an advertisement information registration request is input, the flow advances from step S104 to step S114 to issue a P-code. In step S115, advertisement information registration processing is executed. By this advertisement information registration processing, the advertisement information table as shown in Fig. 8 is generated and registered in the P service server 200.

When a P-code is input from the...

...a form of a personal P-code (telephone number) having a subcode (suffix) is issued.

When necessary information is acquired in steps S116 to S119, layout of acquired information to be printed on a paper sheet is determined in step S120. In step S121, advertisement information to be laid out in a margin on the paper sheet is acquired (advertisement information search will be described later). In step S122, ...a dialog box shown in Fig. 28 is displayed. The user can arbitrarily input general personal information. The information input herein is mainly used for advertisement information search processing (to be described later in detail).

When the "personal information 2" button 1060 is clicked in the dialog box shown in Fig...

...dialog box shown in Fig. 29 is displayed. The user can arbitrarily input specific personal information. The information input herein is also mainly used for advertisement information search processing (to be described later in detail).

When the "desired information" button 1070 is clicked in the dialog box shown in Fig. 22 information associated with the checked items, attach the information to the margin portion, and output it. The checked items can also be used for advertisement information search processing.

When the "printing paper" button 1080 is clicked in the dialog box shown in Fig. 22, a dialog box shown in Fig...

...the output format. For example, when the "visibility priority" button in the dialog box shown in Fig. 31 is checked, priority is given to the layout of the print, and information obtained by the P service system is printed in a layout easy to see. When the "page count priority" check button is checked, priority is given to saving of page count, so the print cost is expected to be saved. When "details" button is clicked, desired conditions can be selected and designated from a plurality of layout patterns, the amount of advertisement information, and font sizes, which are registered on the P service system.

When the "favorite information registration" button 1090 is clicked in the dialog box...required because size reduction may be required on the P service terminal 100 side due to the paper of the P service terminal 100 or layout of a plurality of IP information output to one paper sheet. If the size can be freely changed on the P service terminal 100 side...

...dialog box shown in Fig. 46 is displayed to set still another property.

In this dialog box, whether the information provider permits automatic attachment of advertisement information when the IP information registered is output from ...P service terminal 100 is set. The information provider checks one of the radio buttons "permit", "permit for lower surface", "not permit" to select setting. Advertisement information is attached within the selected range. When "next" is selected in the dialog box shown in Fig. 46, a dialog box shown in Fig...

...another property.

In this dialog box, the genre and keywords of IP information to be registered are input such that they can be used for advertisement search processing. The items to be input are "genre", "subgenre", and "keyword". "Genre" and "subgenre" are listed in drop-down list boxes. For example, when...

...can be set by the "add" button, and the set keyword can be canceled by the "delete" button.

When the check box "negative link to advertisement" is checked, selection of advertisement information inappropriate to the contents of the registered IP information can be avoided.

Instead of or together with setting the property in the dialog box...

...set.

In the dialog box shown in Fig. 51, the title and summary of the registered IP information are input. This summary is used for advertisement search processing. In addition, when the IP information is requested in the information service, the summary is temporarily disclosed to the user instead of immediately...registration processing. This will be described later with reference to Figs. 71 to 74.

In this way, the entire IP information registration processing is ended.

#### <Advertisement Information Registration>

In the P service system, an advertisement provider who provides advertisement information must register the contents of advertisement information in the P service server 200 or IP server 300.

To do this registration, the advertisement provider accesses the P service server 200 or IP server 300 from a terminal (not shown) (to be referred to as an advertisement provider terminal hereinafter) of the advertisement provider through the Web or presents a storage medium such as a CD-ROM in which contents of advertisement information are stored to the operator of the P service system.

The procedure of advertisement information registration will be described below by exemplifying a case wherein the advertisement provider registers advertisement information in the P service server 200 through the Web.

When the advertisement provider accesses advertisement information registration in the P service server 200 from the advertisement provider terminal, the P service server 200 executes processing in step S114 in Fig. 19 and internally issues a P-code for advertisement information. This P-code is exclusively used for internal processing of the P service server 200 and therefore is not disclosed to the advertisement provider in principle.

After that, the flow advances to step S115 to execute

advertisement information registration processing.

Fig. 54 is a flow chart of advertisement information registration processing.

In this advertisement information registration processing, windows for advertisement information registration are displayed on the display of the advertisement provider terminal, and the advertisement provider is caused to input matters to be registered by so-called GUI, as in the above-described user registration processing and IP information registration processing.

In step S1050, a dialog box shown in Fig. 55 is displayed, and it is determined whether the advertisement provider is a member of the P service system. A member means a person who has made an application as an information provider in advance. A nonmember cannot provide advertisement information because advertisement insertion is charged for. A membership number and password are assigned in accordance with an application.

When the advertisement provider is a member, he/she checks the radio button "Yes" in this dialog box and also inputs the membership number. When the advertisement provider is a nonmember, he/she checks the radio button "No". When "next" is clicked, the flow advances to step S1051 for a nonmember. For a member, a dialog box shown in Fig. 56 is displayed to request to input a password. If the password input by the advertisement provider is authentic, the flow advances to step S1052.

When "next" is clicked in each dialog box, input information is stored, and the flow advances...

...storing input information. This also applies to the following processing.

In step S1051, a dialog box shown in Fig. 57 is displayed to cause the advertisement provider as a nonmember to input information for specifying the advertisement provider. This is because advertisement insertion is charged for, as described above. After the input, when "next" is clicked, the flow advances to step S1052.

In step S1052, a dialog box shown in Fig. 58 is displayed to designate advertisement information to be registered. The advertisement provider inputs the file name of the entity (contents) of advertisement information stored in the advertisement provider terminal. In this case, a plurality of file names can be designated. The functions of the "designate file" and "delete" buttons are the same as in the above-described IP information registration processing shown in Fig. 40. The advertisement information to be registered may be either an image or character information.

When "next" is selected in the dialog box shown in Fig. 58, the flow advances to step S1053.

In step S1053, the contents of the designated file are displayed as a preview (Fig. 59), and the advertisement provider is made to confirm it. After the confirmation, when the advertisement provider clicks the "next", a dialog box shown in Fig. 60 is displayed, and the designated file is transferred to the P service server 200. After the transfer, the flow advances to step S1054.

In step S1054, a property of the transferred advertisement information is set. In setting the property, a dialog box shown in Fig. 61 is displayed, so the date of start of insertion and valid dates (due date of insertion) of the advertisement information can be set. When "next" is clicked in the dialog box shown in Fig. 61, a dialog box

shown in Fig. 62 is displayed to set another property.

In this dialog box, a method of linking the advertisement information to IP information in which insertion of the advertisement information is requested is set. In accordance with the display of the dialog box, insertion of the advertisement information into IP information common in association with any one of the region, age group, sex, and keyword or contents of information can be designated...

...a dialog box shown, in Fig. 64 is displayed to set still another property.

In this dialog box, the size and the like of the advertisement information transferred to the P service server 200 are displayed. The advertisement provider can designate the size in printing, enable/disable state of enlargement/reduction of advertisement information, and print position. For example, when the right arrow of the drop-down list box of the print size selection column is clicked, the list of print sizes is displayed, as shown in Fig. 65, and the advertisement provider can select a desired print size. When "next" is selected in the dialog box shown in Fig. 64, a dialog box shown in Fig. 66 is displayed to set still another property.

In this dialog box, the insertion scheme of the advertisement information to be printed is set. The advertisement provider can check the check box of a desired limitation item to impose the limitation. Except the limitation items shown in Fig. 66, a limitation...

...contents corresponding to color or monochrome print, insertion at the same position when a plurality of pages are printed, or generation of a series of advertisement information. When "next" is selected in the dialog box shown in Fig. 66, a dialog box shown in Fig. 67 is displayed to set still another property.

In this dialog box, a charge for insertion of the advertisement information is set. In this dialog box, a charge per insertion of advertisement information is displayed, and the limit of the total charge can be designated by setting the print count or the upper limit of charge for insertion. When the radio box "designate maximum print count" is checked, the count can also be designated. When the radio box "designate upper limit of advertisement charge" is checked, the upper limit of charge for insertion can also be designated.

Property setting in step S1054 is ended, and the flow advances...

...dialog box shown in Fig. 68 is displayed. The list of input matters is displayed. The P-code is not displayed in principle. When the advertisement provider confirms the display and clicks the "register" button, the flow advances to step S1056. When the "register" button is clicked, a dialog box shown in Fig. 69 may be displayed to allow the advertisement provider terminal to print the particulars of the registered advertisement information.

In step S1056, the P service server 200 stores the information input by the above processing in the advertisement information table shown in Fig. 8 in correspondence with the P-code issued in advance. The information may be transferred to the IP server 300. The P service server 200 always holds the properties (advertisement information table) of the registered advertisement information. However, the entity (contents) itself can be held by either the P service server 200 or IP server 300.

When the advertisement provider will register advertisement information not in the P service server 200 but in the IP server 300 from the advertisement provider terminal, registration is generally done according to the above-described procedure.

In this case, the P service server 200 allocates a usable P-code...

...the allocated area. The IP server 300 finally transfers the assigned P-code and its table information to the P service server 200 to perform advertisement information registration processing.

In this way, the entire advertisement information registration processing is ended.

<P-code Issue Processing>

P-code issue processing in steps S111, S112, and S114 in Fig. 19 will be described...temporary issue of another IP code and determination are repeated until an IP code is finally issued.

The procedure of issuing a P-code for advertisement information is basically the same as the procedure of issuing a P-code for IP information.

<Description of Various Services>

Details of information acquisition processing...information in printing the information displayed in the area 2027 is displayed. The area 2028 has a button 2028a which is pressed to print an advertisement together with the information. When the button 2028a is pressed, a window shown in Fig. 28 is displayed to set advertisement insertion conditions. This window will be described later in detail.

A button 2029 is pressed to display the print preview of information to be printed...

...the window 2025 shown in Fig. 80 is pressed, a window 2038 shown in Fig. 82 is displayed.

In the window 2038, insertion conditions of advertisements to be printed together with information to be printed are set. In the window 2038, the insertion condition set item group (in this embodiment, "print ...

...acknowledge the set insertion conditions. A button 2041 is pressed to cancel the set insertion conditions.

In the window 2038, the user can set the advertisement insertion conditions. Instead, the P service server 200 may search for an appropriate advertisement for information to be printed such that the charge for printing the information to be printed is nullified, and generate print data constructed by the searched advertisement and information to be printed. Advertisement search processing by the P service server 200 will be described later.

Next, a window for executing the mail service, which is displayed when the...

...this area, the button 2028a in the window 2025 shown in Fig. 80 may be displayed to allow the user to set insertion of an advertisement to the mail, or an appropriate advertisement for the mail to be printed may be searched by the P service server 200.

A button 2048 is pressed to display a print preview...including the property data, preview image, and the number of pages, on the touch panel 104 (Fig. 80). If a print preview or setting for advertisements is instructed, corresponding windows (Figs. 81 and 82) are appropriately

displayed to receive inputs from the user.

In step S2504, (8) it is determined whether...acquisition of IP information (the above-described processing in steps S3202 to S3207) is executed using the P-code registered in the P-code list.

#### <Advertisement Search Processing>

In the P service system, when a user obtains a print output from the P service terminal 100, predetermined advertisement information is automatically attached to the print unless the user or information provider rejects it. Processing of searching for advertisement information to be attached will be described below.

Fig. 104 is a flow chart of advertisement search processing.

In step S3001, a keyword list of information of the information service or personal information service, mail of the mail service, or information ...

...numerical value is given to each keyword in consideration of universally accepted idea on the basis of the contents and used to define priority of advertisement information in advertisement search processing. A numerical value with "+" means that IP information or the like including the keyword has positive contents when viewed from the universally accepted...lowest priority keyword list set on the system side can be prepared.

The highest priority keyword list is a list of keywords corresponding to an advertisement that informs, e.g., a special campaign held on the P service system. An example of this keyword list is shown in Fig. 105D.

The lowest priority keyword list is a list of keywords with which at least one advertisement information can be searched for and is prepared to prevent advertisement search processing from searching no advertisement information. Hence, as a lowest priority keyword, a keyword having wide meaning is used.

In step S3002, using each keyword as a search key on the basis of the keyword lists prepared in step S3001, advertisement information having a keyword matching the search keyword is searched for. In step S3003, the search result list is prepared.

Figs. 106A to 106E are...

...five keyword lists.

Fig. 106A shows a search result list corresponding to the keyword list of IP information (Fig. 105A), in which five pieces of advertisement information are searched for by the keyword "marriage". In this list, "weight" is a numerical value given to the keyword in each advertisement information and has the same meaning as the above-described "weight". The "degree of matching" is a numeral value obtained by multiplying the numerical value...

...in Fig. 106A are filled with results obtained by multiplying "+10" by each of weights "+10", "-5", "+3", "-4", and "+7" of the keywords of advertisement information.

In this advertisement search processing, an advertisement having a larger value of "degree of matching" has a higher priority of insertion. As the value becomes small, the priority becomes low.

As shown in Figs. 106A and 106B, a single keyword has many weights. This is because advertisement information including the keyword "marriage" may be an advertisement of a wedding ceremony hall or an

advertisement of divorce consultation. If they are regarded to be equivalent, inappropriate advertisement information may be inserted into contents of information to be printed.

In processing of this embodiment, if negative advertisement information is searched for in correspondence with positive IP information, values with signs "+" and "-" are multiplied. The degree of matching has a negative value, and the priority can be made low. If negative advertisement information is searched for in correspondence with negative IP information (e.g., an advertisement of funeral and an advertisement of a hospital), values with signs "-" and "-" are multiplied. The degree of matching has a positive value, and the priority becomes high.

In step S3004, the pieces of advertisement information in the search result list are rearranged by looking up the properties of advertisement information.

In rearranging the pieces of information, on the basis of the properties of each advertisement information, a value is added to or subtracted from the degree of matching calculated in advance. For example, an advertisement whose term of insertion has expired or charge exceeds the maximum charge must not be inserted, and a predetermined numerical value can be subtracted from the calculated degree of matching. On the other hand, for an advertisement whose limitations on printing (designated in the dialog box shown in Fig. 65 or 66) are lenient, a predetermined numerical value can be added to the calculated degree of matching for evaluation. This is because such advertisement information can cope with an arbitrary layout and has a higher degree of freedom for printing.

To evenly give opportunities for insertion while giving priority to an advertisement with low insertion frequency, a numerical value corresponding to the insertion frequency may be added to the degree of matching.

In addition, a predetermined numerical value may be added to the degree of matching with priority given to an advertisement for which a large charge is paid from the advertisement provider to the operator of the P service. An advertisement provider who pays a large charge should be treated favorably. This also easily excuses the user compensation for the received service.

With priority given to an advertisement directly associated with information desired by the user, a predetermined numerical value may be added to the degree of matching for the purpose of increasing the business chance of the advertisement provider.

In this way, values are added to or subtracted from the degrees of matching to calculate final numerical values. Figs. 107A to 107E show lists of advertisement information rearranged in descending order of the magnitudes of values. As is apparent from Figs. 107A to 107E, the degree of matching is not always proportional to the numerical value of "weight".

In step S3005, a layout example of advertisement information is prepared. A plurality of layout examples are prepared by picking up pieces of advertisement information from the search result lists shown in Figs. 107A to 107E in descending order of priority.

Priorities may be defined in units of search result lists shown in Figs. 107A to 107E. For example, first advertisement information may be picked up from the search result list of the highest priority list (Fig. 107D), and then pieces of advertisement information may be

sequentially picked up from the search result list of IP information (Fig. 107A), the search result list of user registration (Fig. 107B...

...result list of the P service terminal (Fig. 107C), and the search result list of the lowest priority list (Fig. 107E).

In step S3006, one layout example that is supposed to be most appropriate is selected from the layout examples of advertisement information in consideration of the user's desire, print size, and total charge. The P-code and layout conditions of the advertisement information are specified and temporarily stored, and advertisement search processing is ended.

<Operation of Portable Terminal>

The P-code extraction function and P-code transmission function of the portable terminal 400 according to...

...CLAIMS herself can expect contents or type of the first information.

Figs. 81 and 82 are flow charts showing the control sequence of the CanDINet control unit 100 in displaying a registration frame image;

Fig. 83 is a flow chart showing the control sequence of the CanDINet control unit 100 in an advertisement area determining process on the front surface;

Fig. 84 is a flow chart showing the control sequence of the CanDINet control unit 100 in an advertisement area determining process on the back surface; and

Fig. 85 is a flow chart showing the control sequence of the CanDINet

control unit 100 in an advertisement area determining process on a separate sheet.

#### DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

(First embodiment)

Fig. 1 is a view showing an embodiment of the information...flow chart showing the function of the CanDINet control unit 100 in the layout determination process. At first the CanDINet control unit 100 executes an advertisement area securing process for securing an advertisement area (step S2001).

Fig. 80 is a flow chart showing the function of the CanDINet control unit 100 in the advertisement area securing process. At first there is determined the ratio of the amount of advertisement (step S8001). In the present embodiment, the advertisement ratio is selected...

...2) printing the advertisement on the separate sheet, the advertisement ratio in this stage is selected as 0. It is however memorized to form an advertisement area on the back side in case of selection (1), and to form an advertisement area on another sheet in case of selection (2).

Then there is discriminated whether a predetermined layout is to be used for all the services, or...

...mode of the CanDINet control unit 100 for providing the advertisement service.

If the predetermined layout is to be used for all the services, the advertisement area is secured with such predetermined layout. In this case, the size of the advertisement area follows the ratio of amount of the advertisement. In the present embodiment, the predetermined layout is given by 7902 in Fig. 79.

If the layout is to be changed according to the service type, the advertisement area is secured with a layout corresponding to each service type. Also in this case, the size of the advertisement area follows the ratio of amount of the advertisement. In the present embodiment, the layout for the mail print service is given by 7901 or 7902...

...tries to secure the area of the information size for placing such information data but such area overflows from the sheet size or invades the advertisement area, the layout is made on the next page.

If the priority is given to the page number in generating the print data (step S2002 - No...

...present (step S2010 - No), the area containing the information data is enlarged within an extent not overflowing from the sheet size and not invading the advertisement area (step S2012), thereby expanding the information data as far as possible.

If the step S2009 places the information data and tries to secure the area of the information size for placing such information data but such area overflows from the sheet size or invades the advertisement area, the layout is made on the next page.

(Advertisement area determination process)

In the following there will be explained a process for determining the advertisement area. Fig. 21 is a flow chart showing the function of the CanDINet control unit 100 in determining the

advertisement area.

At first, the advertisement area is selected as the print area by the printing unit of the kiosk terminal minus the information data area (step S2101).

Then there is prepared...

...select one of such predetermined sizes at the registration of the advertisement.

Then there is discriminated whether the advertisement size can be accommodated in the advertisement area (step S2103). If accommodatable (step S2103 - Yes), there is secured an advertisement area of such advertisement size (step S2104), and the advertisement area is defined as the remaining advertisement area after such securing (step S2105).

If the advertisement size cannot be accommodated in the advertisement area (step S2103 - No), there is discriminated whether the advertisement size is the smallest advertisement size (step S2106). If there is a smaller advertisement size (step...

...step S2104, there are memorized the secured advertisement size and the secured location.

In the following there will be explained the process of determining the advertisement area in case the advertisement is to be printed on the back side or on another sheet. Figs. 83 to 85 are flow charts showing the function of the CanDINet control unit 100 in determining the advertisement area.

At first, the advertisement area is selected as the print area by the printing unit of the kiosk terminal minus the information data area (step S8301).

Then there is prepared...

...select one of such predetermined sizes at the registration of the advertisement.

Then there is discriminated whether the advertisement size can be accommodated in the advertisement area (step S8303). If accommodatable (step S8303 - Yes), there is secured an advertisement area of such advertisement size (step S8304), and the advertisement area is defined as the remaining advertisement area after such securing (step S8305).

If the advertisement size cannot be accommodated in the advertisement area (step S8303 - No), there is discriminated whether the advertisement size is the smallest advertisement size (step S8306). If there is a smaller advertisement size (step...

...smaller advertisement size (step S8306 - Yes), the sequence proceeds to a step S84 in Fig. 84.

A flow chart shown in Fig. 84 determines the advertisement area in case the advertisement area is secured on the back side. For this purpose, there is at first discriminated whether an advertisement area is secured on the back side (step S8401). The discrimination is made by checking whether the step S8001 in Fig. 80 has memorized securing the advertisement area on the back side.

If the advertisement area is secured on the back side, the advertisement area is selected as the print area by the printing unit of the kiosk terminal minus the information data area (step

S8402). Steps S8403 to 8408...

...83. In case the step S8407 identifies the absence of smaller advertisement size, the sequence proceeds to a step S8501 in Fig. 85.

When an advertisement area is secured in another sheet, the flow chart in Fig. 85 executes a process for determining the advertisement area. For this purpose, there is at first discriminated whether an advertisement area is secured on another sheet (step S8501). The discrimination is made by checking whether the step S8001 in Fig. 80 has memorized securing the advertisement area on another sheet.

If the advertisement area is secured on another sheet, the advertisement area is selected as the print area by the printing unit of the kiosk terminal (step S8502). Steps S8503 to 8508 will not be explained as they are similar to the step S8303 to S8308 in Fig. 83. In case the step S8507 identifies the absence of smaller advertisement size, the advertisement area determining process is terminated. The steps S8304, S8404 and S8504 memorize the secured advertisement size and the secured location.

In an example shown in Fig...

...ABSTRACT be printed on is set when the user designates a stapling position, positions at which stapling is possible are decided in dependence upon the set paper size and these positions are displayed as candidates for selection. The user selects a desired position from among the candidates. The selected position is displayed together with an image of the paper shape indicating the page layout of the paper, the orientation of print data and stapling orientation. Lastly, the candidates for selection are displayed on the image. The stapling position thus set is sent to the printer when printing...

NOTE:

...SPECIFICATION in the manner shown in the bitmap display window 1004 of Fig. 10.

Thus, designatable stapling positions are displayed in conformity with the designation of paper size. At the same time, an image representing the format of a page that reflects the setting of five items can be displayed in the bitmap display window 1004 in dependence upon the five items, namely the designation of paper size, the designation of page layout, the designation of stapling orientation, the designation of print data orientation and the designation of stapling position.

In a case where a designation such as that of paper size has not been made, the processing of Fig. 4 is executed and the image of Fig. 10 displayed using a paper size and paper orientation deemed appropriate beforehand.

<Examples of displays in display window>

Figs. 13A - 13D and Figs. 14A - 14H are examples of images displayed in ...a direction parallel to the short edges, a long edge is the edge at which stapling is possible. Consequently, even if the orientation of the print data is changed, the stapling positions do not change with respect to the shape of the paper. In this example, it is assumed that only paper of legal size cannot be stapled at a position midway along an edge.

Figs. 14G and 14H illustrates cases where (3) has been designated at the stapling position for legal-size paper.

Fig. 14G... Size: legal; Print data orientation:

portrait (stapling position: (3))

Fig. 14H... Size: legal; Print data orientation: landscape

(stapling position: (3))

These cases differ from the other cases. Specifically, since the staple is oriented along the short edge, the mark also is displayed in an...

...Figs. 13A, 13B are examples of displays in a case where a page layout has been set so as to print two pages on one sheet of paper. Paper size is set at A4 and the stapling orientation is set as left or top.

Fig. 13A... Page layout: two-page printing; Print data orientation: landscape; stapling position: (1)

Fig. 13B... Page layout: two-page printing; Print data orientation: portrait; stapling position: (3)

In the case of two-page printing, each page of ordinary size is reduced

to about 70% of ordinary size and the two reduced...  
 ...the marks indicating the stapling positions also are displayed at two locations in accordance with the positions of the staples.  
 By way of example, consider paper of size A4 and the portrait orientation as the orientation of the print data. If the page layout is made one-page printing, then two-page printing and then four-page printing in this case, then the images displayed will as shown in...  
 ...positions capable of being designated, therefore, are displayed in an unselected state.  
 Thus, stapling positions capable of being designated in dependence upon the designation of paper size are displayed and, if a stapling position has been designated, so is the designated stapling position. At the same time, an image representing the format...  
 ...that reflects the setting of five items can be displayed in the display window 1004 in dependence upon the five items, namely the designation of paper size, the designation of page layout, the designation of stapling orientation, the designation of print data orientation and the designation of stapling position.  
 In a case where a designation such as that of paper size has not been made, the processing of Fig. 20A is executed and the image of Fig. 10 displayed using a paper size and paper orientation deemed appropriate beforehand.  
 Fig. 20B is a processing procedure for a case where an input has been made on the screen of...

...SPECIFICATION suitable replacement for traditional camera and photographic film techniques. The traditional film and photographic techniques rely upon a film roll having a number of pre-formatted negatives which are drawn past a lensing system and onto which is imaged a negative of a image taken by the lensing system. Upon the...

...print media using the code sensed from the two dimensional code.

Preferably, the two dimensional code is protected with an encryption algorithm.

Ideally, the two dimensional code incorporates error-correcting code.

Conveniently, the error-correcting code is in the form of Reed-Solomon code.

The two dimensional code preferably enables access characterization;

<FIGREF IDREF=F0125>Fig. 206</FIGREF> is an exploded perspective, in section, of the print head ink supply mechanism;

<FIGREF IDREF=F0126>Fig. 207</FIGREF> is a bottom perspective of the ink head supply unit;

<FIGREF IDREF=F0127>Fig. 208...

...of the ACP chip 31 to reduce incremental design cost. Alternatively, a separate 3D Artcam ACP can be designed. This option will reduce the manufacturing cost of a mainstream single sensor Artcam.

Print roll authentication chip 53

A small chip 53 is included in each print roll 42. This chip replaced the functions of the bar code, optical sensor and wheel, and ISO/ASA sensor on other forms of camera film units such as Advanced Photo Systems film cartridges.

The authentication chip...

...The Artcam unit 1 can utilize any color print technology which is small enough, low enough power, fast enough, high enough quality, and low enough cost, and is compatible with the print roll. Relevant printheads will be specifically discussed hereinafter.

The specifications of the ink jet head are:

Optional ink pressure Controller (not shown)

The function of...

...can be inserted. The APC 31 detects the pressing of the button, and reverses the Artcard reader motor 37 to eject the card.

#### Card status indicator 66

A card status indicator 66 is provided to signal the user as to the status of the Artcard reading process. This can be a standard bi-color (red/green...

...Artcam can be carefully managed with all unit being turned off when not in use.

The most significant current drains are the ACP 31, the area image sensors 2,4, the printer 44 various motors, the flash unit 56, and the optional color display 5 dealing with each part separately:

1...in input pixels in relation to output pixels. An example of this is rotation. If an image is rotated 90 degrees, and we process the output pixels horizontally, there is a complete loss of cache coherence. On the other hand, if we process the output image one cache line's width...

...ABSTRACT be printed on is set when the user designates a stapling position, positions at which stapling is possible are decided in dependence upon the set paper size and these positions are displayed as candidates for selection. The user selects a desired position from among the candidates. The selected position is displayed together with an image of the paper shape indicating the page layout of the paper, the orientation of print data and stapling orientation. Lastly, the candidates for selection are displayed on the image. The stapling position thus set is sent to the printer when printing...

NOTE:

...SPECIFICATION in the manner shown in the bitmap display window 1004 of Fig. 10.

Thus, designatable stapling positions are displayed in conformity with the designation of paper size. At the same time, an image representing the format of a page that reflects the setting of five items can be displayed in the bitmap display window 1004 in dependence upon the five items, namely the designation of paper size, the designation of page layout, the designation of stapling orientation, the designation of print data orientation and the designation of stapling position.

In a case where a designation such as that of paper size has not been made, the processing of Fig. 4 is executed and the image of Fig. 10 displayed using a paper size and paper orientation deemed appropriate beforehand.

&lt;Examples of displays in display window&gt;

Figs. 13A - 13D and Figs. 14A - 14H are examples of images...

...a direction parallel to the short edges, a long edge is the edge at which stapling is possible. Consequently, even if the orientation of the print data is changed, the stapling positions do not change with respect to the shape of the paper. In this example, it is assumed that only paper of legal size cannot be stapled at a position midway along an edge.

Figs. 14G and 14H illustrates cases where (3) has been designated at the stapling position for legal-size paper.

Fig. 14G... Size: legal; Print data orientation:

portrait (stapling position: (3))

Fig. 14H... Size: legal; Print data orientation:

landscape (stapling position: (3))

These cases differ from the other cases. Specifically, since the staple is oriented along the short edge, the mark also is displayed in an...

...Figs. 13A, 13B are examples of displays in a case where a page layout has been set so as to print two pages on one sheet of paper. Paper size is set at A4 and the stapling orientation is set as left or top.

Fig. 13A... Page layout: two-page printing; Print

data orientation: landscape; stapling

position: (1)

Fig. 13B... Page layout: two-page printing; Print

data orientation: portrait; stapling

position: (3)

In the case of two-page printing, each page of ordinary size is reduced to about 70% of ordinary size and the two reduced...

...the marks indicating the stapling positions also are displayed at two locations in accordance with the positions of the staples.

By way of example, consider paper of size A4 and the portrait orientation as the orientation of the print data. If the page layout is made one-page printing, then two-page printing and then four-page printing in this case, then the images displayed will as shown in...

...positions capable of being designated, therefore, are displayed in an unselected state.

Thus, stapling positions capable of being designated in dependence upon the designation of paper size are displayed and, if a stapling position has been designated, so is the designated stapling position. At the same time, an image representing the format...

...that reflects the setting of five items can be displayed in the display window 1004 in dependence upon the five items, namely the designation of paper size, the designation of page layout, the designation of stapling orientation, the designation of print data orientation and the designation of stapling position.

In a case where a designation such as that of paper size has not been made, the processing of Fig. 20A is executed and the image of Fig. 10 displayed using a paper size and paper orientation deemed appropriate beforehand.

Fig. 20B is a processing procedure for a case where an input has been made on the screen of...

...SPECIFICATION in the manner shown in the bitmap display window 1004 of Fig. 10.

Thus, designatable stapling positions are displayed in conformity with the designation of paper size. At the same time, an image representing the format of a page that reflects the setting of five items can be displayed in the bitmap display window 1004 in dependence upon the five items, namely the designation of paper size, the designation of page layout, the designation of stapling orientation, the designation of print data orientation and

the designation of stapling position.

In a case where a designation such as that of paper size has not been made, the processing of Fig. 4 is executed and the image of Fig. 10 displayed using a paper size and paper orientation deemed appropriate beforehand.

<Examples of displays in display window>

...positions capable of being designated, therefore, are displayed in an unselected state.

Thus, stapling positions capable of being designated in dependence upon the designation of paper size are displayed and, if a stapling position has been designated, so is the designated stapling position. At the same time, an image representing the format...

...that reflects the setting of five items can be displayed in the display window 1004 in dependence upon the five items, namely the designation of paper size, the designation of page layout, the designation of stapling orientation, the designation of print data orientation and the designation of stapling position.

In a case where a designation such as that of paper size has not been made, the processing of Fig. 20A is executed and the image of Fig. 10 displayed using a paper size and paper orientation deemed appropriate beforehand.

Fig. 20B is a processing procedure for a case where an input has been made on the screen of...

...SPECIFICATION in that it is applicable to a system capable of temporarily storing, in an upper device such as a computer, data of an intermediate code format different from the print data, and effecting the printing by providing a printing device such as printer with print data prepared according to the temporarily stored data.

The present invention is further featured in that the memory means is adapted to temporarily store an effective print area of the input sheet, a size and an effective print area of the output sheet, an offset value and set enlargement/reduction mode as intermediate codes.

The present invention is further...to be executed in a pre-processing or a post-processing shown in Fig. 12. Thereafter the despooler 304 executes conversion of the intermediate data format into the GDI function format for generating the print data as explained in the foregoing.

Fig. 13 is a flow chart showing the process flow for the enlarged/reduced printing. At first the despooler 305 reads the effective print area of the input sheet, the size of the output sheet, the effective print area of the output sheet, the offset value and the set enlargement/reduction mode (step S1301). This process is achieved by reading the data required for...

...of the print data based on such setting, effecting the centering in an appropriate print position based on the effective print area of the input sheet, the size and effective print area of the output sheet, the offset values and the set enlargement/reduction mode, and, in case printing plural logic pages in a physical page, positioning the plural logic pages in a print position symmetrical in the vertical and horizontal directions, whereby a proper output format can be obtained by the centering of the print data in the

appropriate position in the enlarging/reducing function, and, particularly in the two-side printing, prints can be obtained in a same position on both sides of the...content.

Also according to the present invention, as the memory means of the print control apparatus temporarily stores the effective print area of the input sheet, the size and effective print area of the output sheet, the offset values and the set enlargement/reduction mode in the form of intermediate codes, there can be provided an effect, in case of temporarily storing the data of an intermediate code format different from that of the print data and effecting the printing operation by transmitting the print data prepared from the stored data to the printing device, of providing the enlarging/reducing function...

...as the print control apparatus comprises arrangement means for effecting centering to the appropriate print position based on the effective print area of the input sheet, the size and effective print area of the output sheet, the offset values and the set enlargement/reduction mode, whereby the print data can be centered to an appropriate position in the enlarging/reducing function to obtain a proper output format, and, particularly in a printing device capable of two-side printing, the printing can...

...SPECIFICATION in a preprocessing or a post-processing shown in <FIGREF IDREF=F0012>Fig. 12</FIGREF>. Thereafter the intermediate data format into the GDI function format for generating the print data as explained in the foregoing.

<FIGREF IDREF=F0013>Fig. 13</FIGREF> is a flow chart showing the process flow for the enlarged/reduced printing. At first the despooler 305 reads the effective print area of the input sheet, the size of the output sheet, the effective print area of the output sheet, the offset value and the set enlargement/reduction mode (step S1301). This process is achieved by reading the data required for ...

...of the print data based on such setting, effecting the centering in an appropriate print position based on the effective print area of the input sheet, the size and effective print area of the output sheet, the offset values and the set enlargement/reduction mode, and, in case printing plural pages in a physical page, positioning the plural logic pages in a print position symmetrical in the vertical and horizontal directions, whereby a proper output format can be obtained by the centering of the print data in the appropriate position in the enlarging/reducing function, and, particularly in the two-side printing, prints can be obtained in a same position on both sides of the...

...content.

Also according to the present invention, as the memory means of the print control apparatus temporarily stores the effective print area of the input sheet, the size and effective print area of the output sheet, the offset values and the set enlargement/reduction mode in the form of intermediate codes, there can be provided an effect, in case of temporarily storing the data of an intermediate code format different from that of the print data and effecting the printing operation by transmitting the print data prepared from the

stored data to the printing device, of providing the enlarging/reducing function...

...as the print control apparatus comprises arrangement means for effecting centering to the appropriate print position based on the effective print area of the input sheet, the size and effective print area of the output sheet, the offset values and the set enlargement/reduction mode, whereby the print data can be centered to an appropriate position in the enlarging/reducing function to obtain a proper output format, and, particularly in a printing device capable of two-side printing, the printing can...

...CLAIMS device such as a printer.

9. An apparatus according to claim 8, further comprising:  
storage means for temporarily storing the data in an intermediate code format different from that of the print data; and  
preparation means for preparing the print data based on said temporarily stored data.
10. A print control method for executing layout of a print sheet, comprising:  
an area determination step of dividing a physical page by N (N being a natural number) thereby determining a print area corresponding to a logic page;  
an...

...said determined print area is arranged with an enlargement or a reduction in said print area, and outputting the processed data in said drawing data format to said drawing means; and  
a print data generation step of converting said received print information into print data consisting of control commands, and outputting said print data to an external device.

24. A print control apparatus for controlling printing, comprising:  
memory means for storing the effective print area of an input sheet, the size and effective print area of an output sheet, offset values and a set enlargement/reduction mode;  
discrimination means for discriminating said set enlargement/reduction mode...

...featured in that it is applicable to a system in which an upper device such as a computer temporarily stores data of an intermediate code format different from that of print data, and printing is executed by transmission of the print data prepared from said temporarily stored data to a printing device such as a printer.

26. An apparatus according to claim 24, wherein said memory means is adapted to store the effective print area of said input sheet, the size and effective print area of said output sheet, the offset values and the set enlargement/reduction mode as intermediate codes.
27. An apparatus according to...

...featured in that it is applicable to a system in which an upper device such as a computer temporarily stores data of an intermediate code format different from that of print data, and printing is executed by transmission of the print data prepared from said temporarily stored data to a printing device such as a printer.

33. A method according to claim 31, wherein said memory step is adapted

to store the effective print area of said input sheet, the size and effective print area of said output sheet, the offset values and the set enlargement/reduction mode as intermediate codes.  
34. A method according to...

...SPECIFICATION system 21 and the printer 31 will now be discussed with reference to Figs. 5A and 5B.

Fig. 5A is a schematic representation illustrating the structure of data D1 transmitted from the print data generation system 21 to the printer 31. The data D1 has seven fields of request type,

acceptance information, host address, command system, the number of print pages, paper size, and color information. The request type indicates that the data D1 is a temporary print request, an actual print request, or a cancel request.

For...

...total number of pages to be printed is set in the number of print pages field, the print recording medium size is set in the paper size field, and the print type (color or monochrome print) is set in the color information field.

The structure of the data D1 transferred from the print data generation system 21 to the printer 31 is not limited to that shown in Fig. 5A. For example, to issue an actual print request, the...

prescribed patterns.

Reference numeral 213 designates a PCU (process control unit) for  
controlling image forming portion 102.

In the above configuration, the print data

(image information/image data to be reproduced) transmitted from the host  
computer is received by the image forming apparatus (laser printer)

through centro-interface 200...

#### Claim

... a new DMA descriptor is made available by software. In circular buffer  
 mode, a new descriptor contains updates to the parameters of the single  
 buffer area being used for a particular endpoint, to be applied  
 immediately by the hardware. In double buffer mode a new descriptor  
 contains the parameters of a...

...which may be read from. DmalnnStrmPtr points to the next address to be  
 read from and is incremented after each memory access. In streaming mode,  
 data transfer from DRAM to the endpoint's local packet buffer is  
 initiated when the local buffer is empty. The DMA controller fills the  
 local packet...There are five bulk OUT endpoints in the LTDU. At full  
 speed, wMaxPktSize can be 8, 16, 32 or 64 bytes, as programmed in the

configuration register FsEpSize. At high speed, wMaxPktSize is 512 bytes. The endpoint data is transferred into the local packet buffer, and from there it is written...

...are four bulk IN endpoints available in the UDU. At full speed, wMaxPktSize can be 8, 16, 32 or 64 bytes, as programmed in the configuration register FsEpSize. At high speed, wMaxPktSize is 512 bytes. Each bulk IN endpoint has a dedicated 64-byte local packet buffer. When data is requested...

...available for that transfer. The host may start a new transfer, and retrieve any remaining data, 64 bytes at a time. I 0 If the data is unavailable (if the local packet buffer does not contain either a full packet or the first 64 bytes of a packet), the UDU issues...

...ms. 1 5 IntVbusTransition This indicates that the input pin gpio -udLk-vbus status has changed state from Vto'l o or vice versa. The configuration register VbusStatus contains the present value of this signal. 1 6 IntBufOverrun In streaming mode, an OUT packet was received but the local control or...

...IN Taken care of by UDC20, not seen by the application  
SET-ADDRESS OUT Taken care of by LIDC20, not seen by the application  
SET-CONFIGURATION OUT Passed to the application via an interrupt which must be acknowledged (IntSetCsrCfg).  
SET-DESCRIPTOR OUT Passed to the application via the Endpoint 0 OUT...

...stage, a status write will be issued by the UDC20 to indicate whether the transaction was successful. If the transaction was not successful, the IN data is kept in the local buffer and the USB host 5 is expected to retry the t.ransaction. If the transaction was successful, the IN data is flushed from the local buffer. There may be more than one data transaction in the Data stage, if the amount of data to be sent is greater than WaxPktSize0. Any extra data packets are transferred in a...

...how the configuration register StatusOutResponse is programmed, which is described in Table 53. There are four options:  
a. the response is a NAK and the data (if present) is discarded  
b. the response is an ACK and the data (if present) is discarded  
c. the response is an ACK and the...data ends up in the circular buffer in DRAM. The following lists the different scenarios.  
All modes  
If the packet was received successfully, any remaining data is written out to DRAM and an interrupt is triggered on IntEpnOutPktWrAlB. If it was a short or zero length packet, an interrupt also occurs...

...not assert its  
udt@  
qpu rd tually been written to the  
y signal in response to a CPU bus write until the data has ac  
configuration register in the UDC20, when the signal udc20-csrrack

is asserted. Therefore, bus latency will be a couple of cycles higher for all writes to...

Detailed Description

Detailed Description

... According to a first aspect of the invention, there is provided a printing cartridge which comprises a housing; and a radio frequency tag that is positioned on the housing, the radio frequency tag carrying data relating to at least one of: a serial number of the cartridge, a media ...media and media colorant of a printing cartridge, the method comprising the step of reading a radio frequency tag positioned on a housing of the printing cartridge with a radio frequency tag reader positioned in a printing device with which the printing cartridge is engaged, the radio frequency tag carrying data relating to the media and the media colorant of the printing...wafers. CCD's are usually built in 6" wafer fabs, and economics may not allow a conversion to 12" fabs. Therefore, the difference in fabrication cost between CCD's and CMOS imagers is likely to increase, progressively favoring CMOS imagers. However, at present, a CCD is probably the best option.

The...of the ACP chip 31 to reduce incremental design cost.

Alternatively, a separate 3D Artcam ACP can be designed. This option will reduce the manufacturing cost of a mainstream single sensor Artcam.

Print roll authentication chip 53

A small chip 53 is included in each print roll 42. This chip replaced the functions of the bar code, optical sensor and wheel, and ISO/ASA sensor on other forms of camera film units such as Advanced Photo Systems film cartridges.

The authentication chip...The Artcam unit 1 can utilize any color print technology which is small enough, low enough power, fast enough, high enough quality, and low enough cost, and is compatible with the print roll. Relevant printheads will be specifically discussed

hereinafter.

The specifications of the ink jet head are.

Image type Bi-level, dithered  
Color CMYK Process Color  
Resolution 1600 dpi  
Print head length 'Page-width' (100mm)  
1 Print speed 1 2 seconds per photo  
Optional ink pressure Controller (not shown)

The function of the ink pressure controller depends...to be the same as that used in the Artcam, with 1600 dpi (63dprnm) resolution. A major feature of the Artcard 9 is low manufacturing cost. Artcards can be manufactured at high speeds as a wide web of plastic film. The plastic web ...can be inserted. The APC 31 detects the pressing of the button, and reverses the Artcard reader motor 37 to eject the card.

Card status indicator 66

A card status indicator 66 is provided to signal the user as to the status of the Artcard reading process. This can be a standard bi-color (red/green...LCD, similar to those currently provided on silver halide and, digital cameras. Its main function is to show the number of prints remaining in the print roll 42 and icons for various standard camera features, such as flash and battery status.

Color display 5

The color display 5 is a full...types of images manipulated by the ACP. They are.

-CCD Image, which is the Input Image captured from the CCD.

-Internal Image format - the Image format utilised internally by the Artcam device.

Print Image - the Output Image format printed by the Artcam

These images are typically different in color space, resolution, and the output & input color spaces which can vary from camera to...the CPU responsible for loading it up. For the same space on chip, this tradeoff reduces the maximum size of any one function to the size of the RAM, but allows an unlimited number of functions to be written in microcode. Functions implemented using microcode include Vark acceleration, Artcard reading, and...flags can be used to generate coordinates that are then passed down the Input FIFO. The VLIW process can use these coordinates and create the output data appropriately.

Box Read Iterator

The Box Read Iterator is used to present pixels in

Detailed Description  
Claims

Detailed Description

... 131).

The apparatus (1, 101) according to the first aspect further comprises  
price option selecting means (2, 102, 103) for allowing a user to select  
price options for  
15 printing the image information, wherein  
the print means (14, 123) prints the image information read by the image  
information read means (3, 104) on the sheet...

...above structure, the printing apparatus prints the  
advertisement information on the sheet together with the image  
information, therefore, the advertiser bears full or part of print  
cost. Therefore, a user obtains printed images, especially digital  
images at a low cost. The payment selecting 25 means allows the user to  
optionally pay full cost to obtain resultant prints which are  
occupied by the image information.

The apparatus (1, 101) according to the first aspect, wherein the image

information includes plural sets of unit...The current counter value represents any one of the printers 14-1 to 14. Now back to FIG. 4, the main controller 7 calculates total fee corresponding to the total print quantity N, and controls the display/operation panel 2 to display the total fee (step S5). The fee is calculated by, for example, quantity x...frame memory B2. The main controller 7 further reads the ad image data set from the ad image memory B3, and develops it in an ad image area of the frame memory B2. Thus, the developed image and ad image are synthesized in the frame memory B2 which stores data for one image...

...image area B2- 1, and the ad image data set representing the ad image read from the ad image memory B3 is developed in the ad image area 132. The ad image may be a text-only image, a photograph of celebrities or professional athletes provided by the advertiser, illustrated characters, or the...the target data image on the read 1 0 image area 132-1 in the frame memory B2 without writing the ad image on the ad image area 132-2; and outputting thus prepared image data sets to the distribution controller B4 which sequentially distributes the image data sets to the printers 14...structure. For example, when a user inputs print designation, the print vending machine I provides the user with a 1 0 card on which a bar code for identification, outlet box No., and assumed print complete time are printed, and the outlet box is locked until the user shows or inserts the card into a bar code reader. Thus, only the user who actually operates the print vending machine I is allowed to take out the printed sheets. According to the above...

...That is, the ad images are previously printed on the back surface of the print sheet.

20 According to this case, the user also enjoys cost reduction because the advertiser bears the printing cost fully or partially. The number of the printers is not limited to 8. Arbitrary number of the printers may be applicable, but at least two...this embodiment. The print vending machine 101 comprises a display/operation panel (display and touch panel) 102, input keys 103, media slots 104a to 104e, indicator lamps 105a to 105e, a fee display 106, a bill slot 107a, a coins slot 107b, a cancel button 108, a receipt insert slot 109...images captured by, for example, frame by frame. The digital images may be converted digital data which originates from images captured by a scanner.

The indicator lamps 105a to 105e comprises, for example, LED (Light Emitting Diode), and corresponds to the media slots 104a to 104e respectively for 20 indicating that the media is being inserted. For example, the indicator lamp 105c is lit when a memory stick is inserted correctly in the media slot 104c, thus, a user confirms the right insertion.

The bill...and coins inserted into the bill/coin slot 107, 25 displays counted value on the fee display 106, and checks whether the account fits the fee in accordance with the designated print quantity. The account manager 136 performs processing in accordance with an instruction...C) ink band toward the print sheet, thus, images are formed thereon.

Each of the unit printers 123-1 to 123-8 further comprises a sheet width sensor which senses the width of the print sheet 153, a sheet emptiness sensor which detects whether the print sheet 153 is supplied or not... displays the result on the display/control panel 102 and fee display 106 (step S504). The fee is calculated by, for example, quantity x 5 price/sheet (depending on print size) + tax.

Then, the user selects the service mode through the mode selecting icons displayed on the display/control panel 102 (step S505). In a case...130 selects one which shows the largest number of the sheets from available ones of the unit printers 123-1 to 123-8, and transfers print information to the selected printer. This structure allows non-stop operation if all of the unit printers 123-1 to 123-8 are available ones, thus, improving print speed of the automatic...the print sheets 153. Each of the unit printers 123-1 to 123-8 may be compatible with different types of print sheets (for example, sheet size). Distribution processing suitable for such the case will now be described.

FIG. 23 is a flowchart for explaining such the distribution processing. For comprehensive explanation...In response to power on, each of the unit printers 123-1 to 123-8 detects size of the print sheets 153 with using a sheet width sensor WS (see FIG. 17), and the 0 detection results are input to the print controller 140. Each print controller 140 informs the main controller 130 of the detection results given by the relating sheet width sensor WS. Thus, the main controller 130 recognize widths of the print sheets 153 in the unit printers 123-1 to 123-8 (step S1001). The sheet width sensor WS detects the sheet width by sensing the position of an upright plate which 5 is slidably moved in accordance with the sheet width in a sheet cassette. The main controller 130 may asks the unit printers 123-1 to 123-8 the sheet size respectively.

After the pre-print processing shown in FIG. 18, the main controller 130 prepares print jobs and stores them in the buffer B 161... holds the print job ("YES" at step S 1002), the main controller 130 reads the print information included in the print job to determine the sheet size (step S 1003).

The main controller 130 select ones from the unit printers 123-1 to 123-8, which are available and compatible with the determined sheet size (step S 1004).

If the designated print size is "L size", for example, the unit printers 123-1 to 123-3 are selected. Then, the instead of the sheet width sensor WS.

The automatic print vending machine 101 according to this embodiment may have warning function which informs a user of print sheet exhaustion in ...set start the printing (step S I 1 16). A method same as that shown in FIG. 19 or FIG. 20 is applicable to the print information distribution.

1 0 The above described structure avoids the user from extra

unnecessary designation for substantially impossible printing. This structure also allows the user to select printing with quantity designated so far...was issued. At the estimated time, the user may approach the vending machine 101 and picks up his/her prints from the outlet where the indicator 170 indicates his/her ID.

Moreover, next user can immediately follow to use the vending machine 101 without waiting for completion of outputs for the...will be done in accordance with the fetched print spec information.

FIG. 27 exemplifies user information printed on a receipt. As shown in FIG.

27, bar codes representing user ID and password are printed on the receipt.

If a user designates print spec such as brightness, contrast, and color balance at the...

Claim

... 131).

2 The apparatus (1, 101) according to claim 1 further comprising price option selecting means (2, 102, 103) for allowing a user to select price options for printing the image information, wherein said print means (14, 123) prints the image information read by said image information read means (3, 104) on said sheet...

 Detailed Description

#### Detailed Description

... graphical image, or motion video rather than text, but have no way of knowing based on the presence of a hypertext link whether

2  
 SUBSTITUTE SHEET (RULE 26)

the tarizet document contains such information. As a result, they are often required to jurrip to the other document just to discover whether ...to-many relationship, i.e., the Child Para aph ID can store many Paragraph IDs. As a result, one page or

9  
 1 5  
 SUBSTITUTE SHEET (RULE 26)

screen can be linked to many paragraphs, i.e., many paragraphs can appear on each screen. See, for example, Fig. 4.

Similarly, the...screen, which can be accessed by following the links through Screen Table 28 and Link Table 24 to the Paragraph table 22.

2 1  
 SUBSTITUTE SHEET (RULE 26)

The relative positions within the hierarchy of the source screen containing the paragraph containing the hypertexted word or phrase and the tarizet screen...

...Fig. 3), which is linked in a one-to-many relationship to the Type field in the Hypertext Nodes 34. The system can

2 2  
 SUBSTITUTE SHEET (RULE 26)  
 automaticaliv determine the proper color coding based on the node type, and the node types can be automatically and dynamically updated after the ...provides for some of the quality control testing described above relating to pages, such as verifying default parents and checking subchapter structure.

2 8  
 SUBSTITUTE SHEET (RULE 26)  
 Fig. 12 is a "Chapter Editor" screen similar in function and appearance to the "Page Editor" screen. This screen allows for the setting...claims.

...g. printer, controlling device, has display unit e.g. cathode ray tube display, for deciding positions at which binding is performed, in dependence upon set paper size, where unit displays positions as candidates

Alerting Abstract ...NOVELTY - The apparatus has size setting unit for setting paper size, and a display unit e.g. cathode ray tube (CRT) display, for deciding positions at which binding can be performed, in dependence upon the set paper size, where the display unit displays the positions as candidates. A selecting unit selects a desired position from the candidates displayed, and a transmitting unit transmits ...

Alerting Abstract ...central processor unit (10A) is connected to a cutting position determination device (14) for determining a cutting position of printing paper and has a cutting position automatic calculation function based on print information stored in a mechanical controller (11). The image signal stored in a frame memory (21) is converted by a transfer circuit (23) into print data...

ABSTRACT

... In the print control device 40 having a print data generation means 50 from generating print data from receiving data on a job bases, the print data generation means 50 includes a layout information generation means which generates layout information for regulating a layout in a printable range 81 based on the number of pages and paper size of the job; and an arrangement means which arranges each page of the job on one print screen according to the paper size to be overlapped while reducing the size thereof based on the layout information generated by the layout information generation means to thereby generate cascade print data.

ABSTRACT

... print controller capable of switching output layout according to the number of pages of printing data stored in a hot holder and simply printing different layouts.

SOLUTION: The print data is stored in the hot holder as a storage area for storing the print data, storage of the print data in the hot holder is...

... of printed pages included in the print data is detected. When the detected number of pages is one page, an output layout according to output sheet width is generated. When the detected number of pages is 2 pages or more, an output layout by arranging the respective pages is generated and the print data is registered as a job of print output.

#### ABSTRACT

PROBLEM TO BE SOLVED: To print data of various file formats being transmitted from a portable terminal, a digital camera, and the like, provided with a wireless interface for delivering/receiving data to/from a peripheral device while selecting a sheet size suitable for that file format automatically.

SOLUTION: The printer comprises a wireless interface for transmitting/receiving data to/from an external device, a means for... external device through a file exchange protocol on the wireless interface, a means for judging the type of the file, a means for selecting a sheet size and a print mode stored in the printer from the type of the file, a means for editing the file according to a selected sheet size and converting it into print data, and a means for printing the print data.

#### ABSTRACT

... right end and X1+X3 (step) at the trailing end. When lower end print processing of the sheet P is performed, the printer compares a sheet size specified by a printer driver with an actually detected sheet size. When the specified sheet size coincides with the actual sheet size and end margin zero printing is performed, print data subsequent to position R is

subjected to masking thus preventing useless consumption of ink.

#### ABSTRACT

PROBLEM TO BE SOLVED: To obtain a printer system in which the sheet size can be recognized accurately and printing can be carried out in optimal format depending on the sheet size.

SOLUTION: The printer system 10 comprises an ink jet printer 12 and a PC 14. The ink jet printer 12 executes printing according to designation from

the PC 14. When a mode for recognizing the sheet size automatically (automatic sheet recognition mode) is set by the PC 14, an automatic sheet recognition command is transmitted to a CPU 16 following to a print start command. In response to the automatic sheet recognition command, the CPU 16 designates a control circuit 20 to take out a sheet, detect the length of the sheet based on the output from a second sensor 28 and then detect the width of the sheet based on the output from...

... The CPU 16 transmits the size data of detected length and width of the sheet to the PC 14. The PC 14 sets an optimal format for the print data depending on the size data before transmitting the print data to the ink jet printer 12.

#### ABSTRACT

PURPOSE: To ensure that data can be printed within the width of a printing sheet by detecting the width of a printing sheet based on an output from a sheet detection sensor, then retrieving a maximum printing position from print data to determine a reduction rate based on both sets of information, and further, performing a reduction calculation of image data to output the calculation result...

...CONSTITUTION: A printing sheet width detection part 6 calculates the determined width of a printing sheet and stores it in memory 4 upon the receipt of a detection signal from a printing sheet detection sensor 2. On the other hand, an editing part 5 edits print data entered from a print data receiving part 1, then retrieves a maximum

printing position to prepare an information table and stores the table in memory 4. Next, a reduction rate calculation part 7 calculates a reduction rate based on...

#### ABSTRACT

PURPOSE: To make it possible to alter a format assignment automatically even on the way of printing, by adding format set data and format cancellation data to the print data of a printer  
...

...CONSTITUTION: Format set data 6 and format cancellation data 8 are added to print data 7, and a printer is provided with a data discrimination part 2 and a format data control part 3. The data discrimination part 2 discriminates between the format data 6 and the print data 7. In the case of the format set data 6, the format data control part 3 sets a format assignment, such as sheet size /direction, reduction/enlargement, and writing from top to bottom/writing from left to right. In the case of the print data 7, a printing process is performed. In the format cancellation data 8, the format data control part 3 initializes the format assignment of the printer.

ABSTRACT

PURPOSE: To ensure that an operator can print data satisfactorily on a sheet of a standard format size simply and without any manual labor by calculating a vertical and a horizontal size suited for a sheet with data equal to a single page developed on a bit map, then selecting a factor of multiplication suited for the closest size to a format sheet size among others or a format size, and printing data at said factor of multiplication...

... size and a horizontal size after the development of data equal to a single page in a bit map, a means for calculating a calculated sheet size and previously determined format sheet sizes, and a means for calculating a format sheet size closest to the size calculated using the comparison calculation means are provided on a controller of a printer. Subsequently, an operator can print data satisfactorily on a format size sheet without any manual labor and difficulty.

ABSTRACT

...printer system main body is 2 equipped with a CRT 1, a printing position adjustment switch 3 and a printing switch 4, and a printing position of print data developed in a page buffer on a sheet is displayed on the CRT screen. In addition, the printing position of print data displayed on the CRT screen is set at any site within a sheet size using the printing position adjustment switch 3. Further, a top margin and a left margin for print data set at CRT 1 are set using...
